

While Loop and For Loop

- | Loops can be used over and over, while if-else statement can't |
- | Loops are often used when you use a variable to count, so you can control the amount of commands are done |

While loop:

```
while (Comment):  
    (Command)
```

**As long as (while) this comment is correct:
Do this**

- | The difference between for loop and while loop is that for loops is that you can call things one by one |

For Loop:

```
cars = ['Toyota', 'Audi']
```

```
for car in cars:  
    print(car)
```
